## Dezember 1975

**Zusammenfassung:** Der Monat Dezember war sehr trocken, in den Alpen und im Tessin auch sonnig und mild. Ebenfalls sonnig, aber etwas kühl waren die Jura Höhen. Im Mittelland blieb die Sonnenscheindauer und die Temperatur mehrheitlich unter dem langjährigen Mittel.

**Temperaturen:** Der Jura, das Mittelland, das Engadin und die Alpentäler verzeichneten ein geringes Defizit, d.h. Monatsmittel von 0,2 bis 2 Grad unter dem Durchschnitt. In den Alpen und im Tessin trat ein Überschuss von 1 bis 2 Grad (über 2000 müM von 2–4 Grad) auf.

**Niederschlagsmengen:** Etwa drei Viertel der Schweiz erhielten weniger als 30 % der mittleren Monatssumme. Einzelne Regionen (z.B. Rhonetal, Brüniggebiet, oberes Toggenburg, Klettgau) sogar weniger als 10 %! [Monatssumme von Sion = 1 mm; kleinster Wert seit 1901] Zwischen 30 und 60 % fielen in den Kantonen Waadt (ohne Waadtländer Alpen), Neuenburg, Basel-Stadt und Tessin (südl. Biasca), ferner im Misox und im Puschlav. Einzig die Region Genf verzeichnete Niederschlagsmengen um die Norm (80–105 %).

**Zahl der Tage mit Niederschlag:** In der ganzen Schweiz ein Defizit. Im Tessin bis 2 Tage, in den Alpen, im westl. Mittelland und im Jura 6 bis 9 Tage, im zentralen und östlichen Mittelland bis 11 Tage weniger als normal.

**Gewitter:** keine.

**Sonnenscheindauer:** Mit 120–180 % der Norm registrierte das Alpengebiet und der Jura einen beträchtlichen Überschuss an Sonnenscheinstunden. Reichlich besonnt waren auch das Rhone- und Rheintal, das Engadin, das Tessin sowie die Nord-

ostschweiz (100–120 %). Dem gegenüber verzeichnete das Mittelland grösstenteils ein Defizit (Zürich 81 %, Bern 104 %, Lausanne 59 %, Genf 38 %).

**Bewölkung:** Leicht überdurchschnittlich (100–115 %) im Mittelland. Gering im Jura und in den Alpen (70–80 %), besonders in den höheren Lagen (50–60 %).

**Luftfeuchtigkeit:** Berner Oberland, Gotthardgebiet, Wallis, Genferseegebiet und Region Toggenburg–Säntis 5–8 % zu trocken. In den restlichen Gebieten um die Norm.

**Heitere Tage:** Eine normale Anzahl im Mittelland; in den übrigen Gebieten 3–10 Tage Überschuss. **Trübe Tage:** Um die Norm im Wallis und Tessin, 1–4 Tage zu viel im Mittelland und in der Zentralschweiz.

**Starkwind:** In den Niederungen der Alpennordseite am 2. (Westwind mit Böenspitzen bis 100 km/h), und 3. (Südföhn mit Spitzenwerten bis 105 km/h) sowie am 18. (starke Bise in der Westschweiz, Böen bis 85 km/h).

## Witterungsverlauf:

- 1.– 3. *Westlage. Tief über Nordeuropa und dem Mittelmeer.* Am 1. und 3. gebietsweise etwas Niederschlag; nördlich der Alpen am 3. Schneefall bis 900 müM.
- 4.– 5. *Hoch Atlantik–Westeuropa, Tief über Nordeuropa* (Nordnordwestliche Höhenströmung). Alpennordseite anfänglich stark bewölkt, dann sonnig. Alpensüdseite sonnig.
- 6.– 8. *Nordlage. Hoch über dem Atlantik mit Ausläufer bis ins Mittelmeer.* In den Niederungen zeitweilig stark bewölkt, im Alpengebiet und im Tessin vorwiegend sonnig.
- 9.–12. *Flache Hochdruckbrücke über Mitteleuropa, Tief über Nordeuropa.* Am 12. im westl. Mittelland etwas Regen, im Jura Schnee bis 1000 müM. Übrige Schweiz trocken.
- 13.–15. *Hoch über dem Atlantik und Osteuropa, Tief über Südwest- und Nordeuropa.* Auf der Alpennordseite am 15., im Süden am 13. niederschlagsfrei. Übrige Tage etwas Niederschlag.
- 16.–18. *Tief über Südwesteuropa mit Ausläufer nach Mitteleuropa.* Zeitweilig lokale Niederschläge. Nördlich der Alpen Schneefall bis in die Niederungen. Alpensüdseite mild.
- 19.–23. *Bisenlage.* In den Niederungen kühl. Allgemein trocken.
- 24.–25. *Hoch Atlantik–Westeuropa, Tief über Nordeuropa; Westlage.* Nördlich der Alpen kühl und geringe lokale Niederschläge. Südlich der Alpen mild und niederschlagsfrei.
- 26.–27. *Hoch über dem Atlantik mit einem Ausläufer bis Mitteleuropa.* Am 26. in der Nord- und Nordostschweiz noch stark bewölkt, dann sonnig wie in den übrigen Gebieten.
- 28.–31. *Hoch über Mitteleuropa.* Nachts verbreitet Nebel, unter Tags vorwiegend sonnig.

## Jahresübersicht 1975

1. **Zusammenfassung:** Die Jahresmittel-Temperaturen von 1975 liegen fast durchwegs einige Zehntelgrade über dem Durchschnitt. Weniger einheitlich sind die Jahressummen der Niederschlagsmengen. Besonders in der westlichen Landeshälfte und in Graubünden traten Defizite auf. Nur das Tessin verzeichnete als grösseres zusammenhängendes Gebiet einen Überschuss. Die Besonnung war im Jura und Alpenraum normal, im Mittelland dagegen defizitär.
2. **Temperatur:** Ausgesprochen mild waren die Monate Januar und Februar, dann folgte ein kühler März. Leicht überdurchschnittliche Temperaturen gab es anschliessend im April und Mai. Der Juni war kühl. In der zweiten Jahreshälfte zeigt nur der September mit überdurchschnittlichen Temperaturen eine grössere Abweichung von der Norm.
3. **Niederschlag:** Etwas defizitär sind die Niederschlagsmengen in den Kantonen Waadt, Neuenburg, Fribourg, Bern (ohne Jura), St. Gallen, Appenzell und Glarus, ferner im Unterengadin und in Nord- und Mittelbünden. Im Wallis erhielt das Rhonetal zwischen Sierre und Martigny nur 70–80 %, das Simplon- und das Einzugsgebiet der Visp aber 100–130 % der mittleren Jahressumme. In den übrigen Gebieten liegen die Jahressummen grösstenteils um die Norm, örtlich (als Folge ergiebiger Gewitterregen) auch darüber. Trocken waren die Monate Februar, Oktober und Dezember.
4. **Sonnenscheindauer:** Als einziger Monat weist der Februar für die ganze Schweiz eine überdurchschnittliche Besonnung auf. In den übrigen Monaten gab es gebietsweise, besonders im Mittelland, immer wieder Defizite.

## Wetterchronik 1975

### Winter (Dezember, Januar, Februar)

Auf den milden Winter 1973/74 folgte gleich ein zweiter, mit zum Teil noch höheren Temperaturen als im Vorjahr. Schon der Dezember 1974 brachte Monatsmittel, wie sie seit dem Bestehen des Beobachtungsnetzes (1864) erst drei Mal, nämlich 1868, 1915 und 1934, vorgekommen sind. Das für diese Jahreszeit ungewöhnlich milde Wetter blieb im Januar 1975 erhalten. Für die Region Zürich wurde es der wärmste Januar seit 1864. In den Beobachtungsreihen von Bern und Basel finden sich für die gleiche Zeitspanne nur drei Jahre mit ebenso hohen oder höheren Temperaturen. Als dann auch der Februar mit überdurchschnittlichen Temperaturen abschloss, stand fest, dass der Winter 1974/75 für verschiedene Gebiete der Schweiz als der mildeste seit gut hundert Jahren angesehen werden kann. Wegen des milden Wetters blieben die Niederungen ausgesprochen schneearm. Die Nullgradgrenze lag häufig zwischen 1000 und 1500 müM. In den höheren Lagen der Alpen aber hatte sich seit Oktober eine beträchtliche Schneedecke aufgebaut. So erreichte die gesamte Neuschneemenge in Arosa, vom Beginn des Einschneiens bis Ende Januar, 865 cm (Durchschnitt 400 cm).

### Frühling (März, April, Mai)

Im März fiel das Monatsmittel der Temperatur, erstmals nach vier aufeinanderfolgenden Monaten, unter den langjährigen Mittelwert. Die folgenden zwei Monate brachten nur noch geringe Abweichungen von der Norm. Gegen Ende der ersten März-Dekade traten südlich des Alpenkammes ergiebige Niederschläge auf. Vom 8. bis 11. wurden im Simplongebiet, in den südlichen Vispertälern, im Goms und im Nordwesten des Tessins 1 bis 2 Meter Neuschnee gemessen. Bevölkerung und Touristen des Simplongebietes und des Saastales mussten wegen der von Neuschnee und Lawinnenniedergängen blockierten Strassen durch Hubschrauber versorgt bzw. evakuiert werden. Drei Tage vor Frühlingsbeginn, in der Nacht vom 17. auf den 18. März, setzte im Tessin nach einem Gewitter starker Schneefall ein, der den Verkehr praktisch lahmlegte. Locarno-Monti verzeichnete 25 cm Neuschnee. Noch folgenschwerer waren die Schneefälle im April. Vom 3. bis 7. April führte eine kräftige Südwestströmung zu einer Staulage auf der Alpensüdseite. Nördlich der Alpen lag kühle Polarluft, in den Niederungen der Südseite warme Luft aus dem Mittelmeerraum. Den Stauniederschlägen überlagerten sich Frontaleffekte (Gewitter), besonders im Tessin. Die ergiebigen Niederschläge breiteten sich im Gotthard- und Rheinwaldgebiet über den Alpenkamm nach Norden und Osten aus. Auf dem Gütsch (ob Andermatt) schneite es vom 3. bis 7. April während 92 Stunden. In der gleichen Zeitspanne fielen im Bedretto-, Blenio- und Urserental, im Tavetsch, im

Lukmanier- und Hinterrheingebiet etwa 2 Meter Neuschnee. Die Folge davon waren zahlreiche Lawinnenniedergänge mit schweren Schäden (über 13 Millionen Franken in den Kantonen Tessin, Uri und Graubünden) und mehr als einem Dutzend Toten. Besonders hart betroffen wurde Acla im Val Medel. Durch die grossen Schneefälle im April erreichte die Schneedecke an verschiedenen Orten der Alpen Rekordhöhen [Beispielsweise auf dem Gütsch ob Andermatt (2287 müM) und Grimsel-Hospiz (1950 müM) am 11. April 6 Meter; in Hinterrhein (1612 müM) am 10. April 3 Meter].

### Sommer (Juni, Juli, August)

Schon im Monat Mai war die Zahl der Gewittertage ungewöhnlich hoch ausgefallen. Sie blieb es auch in den darauffolgenden Monaten Juni, Juli und August. Am 15. Juni wurden in den Kantonen Waadt, Fribourg, Aargau und Schaffhausen Hagelschäden von insgesamt einer Million Franken angerichtet. Dem Unwetter fiel auch der Schlussumzug des Eidg. Jodlerfestes in Aarau zum Opfer. In der Nacht vom 22. auf den 23. Juni kam es in der Nordostschweiz zu zahlreichen Gewittern mit ergiebigen Regenfällen. Am Spätnachmittag des 23. bildete sich im Raum Zürcher Oberland–Rafzerfeld ein ausgedehnter Gewitterherd. Eine Hagelzone erstreckte sich vom Pfäffikersee über das Zürcher Unterland und Rafzerfeld bis in den schaffhausischen Klettgau. In den Weinbauorten Hallau, Wilchingen, Trasadingen und Osterfingen wurden durch Hagel und Wasserfluten bis zu 70 % der Reben zerstört. Gleichzeitig mussten die Bewohner von Kempttal ein schlimmes Hochwasser über sich ergehen lassen. Der Wasserstand der Kempt stieg auf 3 Meter über den Normalpegel und überflutete den Bahnhof und das Fabrikareal der Maggi-Werke. Heftige Böen zerstörten in den Gemeinden Illnau-Effretikon, Lindau, Nürensdorf und Brütten gegen 120 Hektaren Wald. Weitere Überschwemmungsschäden traten am gleichen Tag im Bezirk Brugg, im Sarganserland sowie in den Kantonen Bern, Thurgau und Basel-Land auf. Die totale Schadenssumme überstieg 20 Millionen Franken. Am 11. Juli verursachte ein Hagelzug im Raum Laupen-Bern schwere Schäden an Kulturen. Die Rebberge von Aigle-Yvorne und Lavaux wurden am 17. betroffen. Ein von Hochwasser unterspültes Bahngeleise der Rätischen Bahn führte am 18. Juli, zwischen Feldis und Küblis, zu einem schweren Zugsunglück. Die starken Regenfälle in Graubünden hatten weitere Verkehrsunterbrüche auf den Strecken Chur-Arosa, Davos-Tiefencastel-Lenzerheide und im Unterengadin zur Folge. Gleichentags erlitten Tabak-, Mais- und Traubenkulturen im Mendrisiotto grosse Hagelschäden. Am 1. August dehnte sich ein Hagelzug von Burgdorf bis zum Zürichsee aus. Ein weiterer folgte am 15. von

Moudon bis ins Berner Seeland. Nach ergiebigen Niederschlägen entlang der östlichen Voralpen, vom 21. bis zum 25. August, kam es im Gebiet von Einsiedeln zu Überschwemmungen. Zürich registrierte in diesen Tagen einen Dauerregen von 44 Stunden. Ende August (29./30.) fielen auch im Einzugsgebiet der Langten grosse Niederschlagsmengen, welche die Strassen von Langenthal bis zu einem Meter unter Wasser setzten. Im Gebiet Rohrbach-Lotzwil entstanden Millionenschäden an Brücken, Häusern, Bahngeleisen und Kulturland.

#### *Herbst (September, Oktober, November)*

Im Herbst war das spektakulärste Ereignis ein Gewitterzug mit Hagel in der Nacht vom 18. auf den 19. September. Der Hagelschlag begann um 23 Uhr in Genf und verlagerte sich mit etwa 70 km/h über die La Côte, das Gros de Vaud, das Broyetal, das Gebiet des Murten- und Bielersees bis in den Basler Jura. Ein Streifen von 200 km Länge und 10–12 km Breite wies mehr oder weniger grosse Hagelschäden auf. An Kulturen wurden besonders Reben, Obst-, Mais- und Rapsplantagen verwüstet. Allein im Kanton Waadt dürften etwa 1'000 Eisenbahn-Wagenladungen Tafelobst zu Mostobst entwertet worden sein.

In der stark betroffenen La Côte gab es bei den Trauben Schäden von rund 11 Millionen Franken. Nach Aussage der Schweiz. Hagelversicherung war dies nicht nur der teuerste, sondern auch der längste Hagelzug der letzten 100 Jahre. Heftige Gewitter mit Regenfällen führten vom 14. bis 16. September im Nordtessin zu Überschwemmungen und Erdrutschen. Einzelne Stationen meldeten Tagessummen bis 150 mm. Betroffen wurde hauptsächlich das Bleniotal, die obere Leventina und Teile des Maggiatales. Gegen Ende des Monats kam es im Einzugsgebiet der Maggia erneut zu wolkenbruchartigen Regenfällen. In Bosco-Gurin wurden am 30. September innerhalb von etwas mehr als 6 Stunden 190 mm Niederschlag gemessen. Diese Unwetter führten zu sehr hohen Monatssummen der Niederschlagsmengen in den betroffenen Gebieten. [Mosogno 676 mm, Cevio 546 mm]. Schliesslich brachte ein Vorstoss subtropischer Luftmassen in den Föhntälern der Alpennordseite am 17. September aussergewöhnlich hohe Temperaturen [Altdorf 32,4 Grad, Bad Ragaz 32,8 Grad, Chur 32,7 Grad]. Ein Temperaturrückgang und verbreitete Schneefälle bis 700 müM kündeten am 11. Oktober den nahen Winter an.

## Gewitter- und Hagelstatistik

Die bis 1970 veröffentlichte Hagelstatistik wird ab 1971 durch eine *Gewitterstatistik* erweitert. Sie schließt teilweise die Lücke, die durch das Sistieren der jahrzehntlang bis 1936 hier ausführlich publizierten jährlichen Gewitterbeobachtungen, inklusive der kartographischen Darstellung der Gewitterzüge an den Hauptgewittertagen entstanden ist. Infolge Sparmassnahmen musste dieser Beitrag ab 1937 leider ausfallen.

Die Tabelle Nr. 1 nimmt die Gewitterstatistik in vereinfachter Form auf:

Wir verwenden das gleiche Reproduktionsschema, wie es bisher in der Liste 2 des Anhanges Nr. 2 der Annalen für den Hagel gebraucht worden ist.

Aufgrund der bei der MZA eingegangenen Gewitterbeobachtungen an meteorologischen und ausgewählten Stationen des Niederschlagsmessnetzes sowie einiger synoptischer Stationen werden alle rapportierten Gewitter berücksichtigt:

1. Die *Nahgewitter* (Gewitter über der Beobachtungsstelle), bei welchen bei der grössten Nähe eines Gewitters zwischen Blitz und Donner nicht mehr als 10 Sekunden vergehen dürfen (Gewitter innerhalb eines 3-km-Umkreises), und

2. die *Ferngewitter* (Gewitter in der Umgebung der Beobachtungsstelle), wo die zeitliche Folge zwischen Blitz und Donner mehr als 10 Sekunden beträgt. Hier kann, je nach dem Lärmpegel am Beobachtungsort und der Tageszeit, ein Umkreis von 5 bis 15 km erfasst werden (Hörbarkeitsgrenze eines Donners).

Nächtliches Wetterleuchten, ohne hörbaren Donner, das bei wolkenarmem Wetter und klarsichtiger Luft auf weit über 100 km Distanz gesehen werden kann, wird in dieser Statistik nicht berücksichtigt.

Die Gewitter werden den einzelnen von 00 bis 24 h dauernden Kalendertagen zugeteilt. Angaben wie: „Gewitter nachts“ ohne nähere Zeitangabe oder: „Gewitter vor bis nach Mitternacht“ werden beiden Tagen zugeordnet. Um diese Fälle möglichst klein zu halten, werden die Beobachter ersucht, durch Festlegen des Zeitpunktes der stärksten Auswirkung die Gewitter möglichst nur einem Tag zuzuordnen. In Zweifelsfällen werden sie zum vergangenen Tag gezählt, was dem von 07 h des Folgetages dauernden „Niederschlagstag“ entspricht. Nur wenn es sich um zwei zeitlich deutlich getrennte nächtliche Gewitterherde handelt, sind diese beiden Tagen zuzuschreiben.

Die *Hagelstatistik* wird im gleichen Sinne weitergeführt, wie sie in den Annalen der MZA für 1957 erläutert wurde. Die folgenden Zeilen enthalten eine Zusammenfassung des damaligen Textes.

Die zweite Tabelle: „Liste der Hagelfälle in der Schweiz“ stützt sich weiterhin ausschliesslich auf die von der Schweizerischen Hagel-Versicherungs-Gesellschaft (SHVG) in Zürich mitgeteilten Hageltage. Die der SHVG gemeldeten versicherten Schäden werden dem betreffenden Ereignistag und der betroffenen Gemeinde zugeordnet. Eine Schadenmeldung eines Versicherten allein genügt, um als Hageltag in die Liste unter dem entsprechenden Kanton aufgenommen zu werden. Sind mehrere Versicherungsnehmer der gleichen Gemeinde am gleichen Tag geschädigt worden, ist ebenfalls nur ein Tag vermerkt. Werden alle an demselben Tag hagelgeschädigten Gemeinden eines Kantons aufaddiert, erhalten wir für den betreffenden Tag den in der Liste enthaltenen Zahlenwert. Eine einwandfreie Vergleichbarkeit dieser Werte untereinander und von Jahr zu Jahr wäre indessen nur unter folgenden, in Wirklichkeit nicht zutreffenden Bedingungen gewährleistet:

1. Die Gemeinden überdecken alle dieselben Fläche.
2. Es befinden sich in allen rund 3100 Schweizer Gemeinden Versicherungsnehmer (was im alpinen Raum nicht der Fall ist).
3. Die Versicherungsnehmer beliben von Jahr zu Jahr die gleichen.
4. Die Zahl der Gemeinden mit wenigstens einem Versicherten bleibt konstant.
5. Alle Hagelschläge verursachten Schäden (dies hängt aber stark von der Art und vom Entwicklungsstand der Kulturen ab).
6. Der Versicherungsnehmer meldet ausschliesslich den genauen Ereignistag. Bei nächtlichen Hagelfällen ist dies jedoch nicht eindeutig; weitere Konfusionen können ferner durch das Verwechseln des Ereignis- mit dem Meldetag entstehen.

Somit bleiben Interpretationslücken bestehen und absolut objektive Vergleiche sind nicht möglich.

Ansichts dieser Umstände wird in der Liste Nr. 3: „Beobachtete Hagelschläge“ die durch Beobachter der MZA-Netze ermittelten Hageltage, nach Landesteilen geordnet, wiedergegeben. Auch hier ist keine gleichmässige Verteilung der Meldeorte über das ganze Land garantiert. Die Zahl der bearbeitbaren Stationen bleibt indessen über mehrere Jahre ziemlich konstant. Damit sind vertretbare Vergleiche von Jahr zu Jahr für die einzelnen Regionen möglich. Die jeweils pro Meldejahr verfügbare Stationszahl ist ab 1971 am linken Rande des ersten Teiles der Gewitterstatistik (Liste Nr. 1) zu finden. Sie ist ebenfalls für die zweite Liste der Hagelstatistik zutreffend. Die räumliche Abgrenzung der in Liste 1 und 3 gebrauchten Regionen findet sich in der Figur auf der letzten Seite 2/8.

| Region                 | Anzahl der Stationen | J.<br>27 | März |    |    |    |    |    | April |     |   |   |   |   |   |    |    |   | Mai |    |    |  |  |

Gebietseinteilung

## Anhang Nr. 3

# Niederschlag

## Monats- und Jahressummen 1975

### Erläuterungen zu den nachfolgenden Tabellen der Monats- und Jahressummen

Linke Seite : Niederschlags - Mengen ( in Millimetern )

Die Bezeichnungen im Tabellenkopf haben folgende Bedeutung :

|           |                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NR        | Stations-Indikativ. Die Numerierung erfolgt nach Flussgebieten von der Quelle zur Mündung.                                                                   |
| STATION   | Ortsbezeichnung                                                                                                                                              |
| HOEHE     | Stationshöhe in Metern über Meer                                                                                                                             |
| JAN, .... | Monatssummen                                                                                                                                                 |
| JAHR      | Jahressumme                                                                                                                                                  |
| NM        | Normalwert = Mittlere jährliche Niederschlagsmenge der Zeit - spanne 1901 - 60                                                                               |
| PZ        | Jahressumme, ausgedrückt in Prozenten des Normalwertes. 100 % entspricht dem Normalwert.                                                                     |
| MX        | Grösster Tageswert = Grösste 24-stündige Niederschlags - menge im Berichtsjahr. Gemessen wird von 07 h 30 des Kalendertages bis 07 h 30 des folgenden Tages. |
| TAG, MON  | Tag und Monat mit dem grössten Tageswert.                                                                                                                    |

Rechte Seite : Niederschlags - Tage ( Niederschlag  $\geq$  1 mm )

Die Bezeichnung NR, STATION, HOEHE, JAN, .... und JAHR haben die gleiche Bedeutung wie oben.

|     |                                                                                                             |
|-----|-------------------------------------------------------------------------------------------------------------|
| NM  | Normalwert = Mittlere Anzahl Niederschlagstage mit mindestens 1 mm Niederschlag in der Zeitspanne 1901 - 60 |
| ABW | Abweichung vom Normalwert im Berichtsjahr. Minus heisst we - niger, plus mehr Niederschlagstage als normal. |

Am rechten Tabellenrand sind weitere Niederschlagstage, nach steigenden Nieder - schlagsmengen, ausgezählt. Es betrifft dies Tage mit :

|           |                  |            |                   |
|-----------|------------------|------------|-------------------|
| $\geq .1$ | 0,1 mm und mehr  | $\geq 20$  | 20,0 mm und mehr  |
| $\geq .3$ | 0,3 mm und mehr  | $\geq 50$  | 50,0 mm und mehr  |
| $\geq 5$  | 5,0 mm und mehr  | $\geq 100$ | 100,0 mm und mehr |
| $\geq 10$ | 10,0 mm und mehr |            | Niederschlag      |

| NR                          | STATION          | HOEHE | JAN | FEB | MARZ | APR | MAI | JUN | JUL | AUG | SEP | OKT | NOV | DEZ | JAHR | NM   | PZ  | MX | TAG | HUN |

# NIEDERSCHLAGS-TOTALISATOREN

FÜR DAS HYDROLOGISCHE JAHR 1974/1975

Die Publikation Niederschlags-Totalisatoren erscheint ab 1974 in leicht abgeänderter Form: So steht die Zusammenfassung über die wichtigsten Ereignisse am Anfang. Die Erläuterungen zu den einzelnen Stationen folgen am Schluss. Die Messwerte der Totalisatoren und Vergleichsstationen sind maschinell ausgedruckt. Diese technische Umstellung verlangt für den Tabellenkopf eine gedrängte Darstellung. Die verwendeten Abkürzungen haben folgende Bedeutung:

|           |                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HER       | = Herkunft der Messresultate; die Buchstaben A - H (sowie MZA) bezeichnen die weiter unten im Bericht aufgeführten Institutionen, welche uns ihre Messergebnisse zur Verfügung stellen. |
| BEG       | = Beginn der Messung; (19..)                                                                                                                                                            |
| EFF       | = effektiv gemessener Wert in der aufgeführten Beobachtungsperiode                                                                                                                      |
| REDUZIERT | = der auf das Hydrologische Jahr (1.10. - 30.9.) reduzierte Wert in cm                                                                                                                  |
| REL.      | = reduzierter Messwert, ausgedrückt in Prozenten des Mittels 1961 - 1970                                                                                                                |
| J.        | = Jahr, in welchem die erwähnten Extremwerte (seit Messbeginn) aufgetreten sind                                                                                                         |
| 61 - 70   | = Mittelwert der Zeitspanne 1961 - 1970                                                                                                                                                 |
| 41 - 70   | = Mittelwert der Zeitspanne 1941 - 1970                                                                                                                                                 |
| ST.ABW.   | = Standardabweichung *; (in Klammern stehen unsichere Werte)                                                                                                                            |
| VAR.K.    | = Variabilitätskoeffizient*; (in Klammern stehen unsichere Werte)                                                                                                                       |
| BEM.      | = Bemerkungen (Ziffer mit Klammer); weisen auf den letzten Teil der Publikation: "Erläuterungen zu einzelnen Stationen"                                                                 |

\* Standardabweichung: Als bekanntestes statistisches Streuungsmass ermöglicht die Standardabweichung einen allgemeinen Ueberblick über die Schwankungsbreiten der Jahresniederschlagssummen an den verschiedenen Totalisatorenstandorten. Da jedoch die Jahresniederschlagssummen je nach Aufstellungs-ort in unterschiedlichem Masse von einer Normalverteilung abweichen, müssen bei einem exakten Vergleich zusätzlich die einzelnen Verteilungen bestimmt und mitberücksichtigt werden.

$$s = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n - 1}}$$

\* Variabilitätskoeffizient: Die Grösse der Streuung hängt bei den Niederschlagssummen in einer bestimmten Region vom Betrag des Mittelwertes ( $\bar{x}$ ) ab. Deshalb erlaubt der Variabilitätskoeffizient einen besseren Vergleich der Streuungsverhältnisse bei über einen beträchtlichen Höhenbereich aufgestellten (und damit stark unterschiedliche Gesamtmengen messenden) Totalisatoren. Stärker abweichende Werte innerhalb derselben Region weisen auf mögliche Inhomogenitäten der Messreihe oder auf eine extreme Aufstellung hin.

$$V = \frac{s}{\bar{x}}$$

## Zusammenfassung der wichtigsten Ereignisse des Berichtsjahres:

a) Neuaufstellungen: Im Sommer 1974 stellten wir wiederum 5 neue Totalisatoren auf, davon 3 im Auftrag des Amtes für Wasserwirtschaft. Es sind dies die Apparate: CHLI SPEER, LAGHETTI BOGA und CHREIALP. Dazu hat die MZA im Testgebiet Breggia einen eigenen Apparat (ALPE DI CASTELLO) aufgestellt. Der fünfte Sammler steht im Tal der Chli Schliere (MAERENSCHLAG) und wurde in Zusammenarbeit mit der Anstalt f.d. forstliche Versuchswesen, Birmensdorf, aufgestellt und dient als Windschutzvergleich. Des weiteren wurde der Totalisator ALBERT HEIM HUETTE nach 23 Jahren Unterbruch wieder in Betrieb gesetzt.

b) Aufgehobene Stationen: Die 7 nur mit Steinhäufen gehaltenen und in sehr schlechtem Zustand befindlichen Apparate im WILDSTRUBELGEBIET wurden abgebrochen, 2 Apparate wurden ersetzt (Neuaufstellung). Die Abteilung für Hydrologie der ETH Zürich hat ihre langjährigen Studien im TAMINAGEBIET abgeschlossen. Von den bestehenden 4 Apparaten wurden 3 abgebrochen. Freundlicherweise übergab uns die Hydrologie den Totalisator PANAERAALP zur Fortführung der Messreihe.

Folgende Institutionen halfen uns bei der Ermittlung der insgesamt 123 Resultate, die wir teils fertig ausgewertet erhielten, teils selbst bearbeiteten:

- A Versuchsanstalt für Wasserbau an der ETH, Abteilung für Hydrologie, 13 Messergebnisse
- B Kraftwerke Hinterrhein AG, Thusis, 5 Messergebnisse
- C Kraftwerke Oberhasli AG, Innertkirchen, 5 Messergebnisse
- E Elektrizitätswerk des Bezirks Schwyz (EBS), 1 Messergebnis
- F Grande Dixence SA, Sion, 16 Messergebnisse
- G Kraftwerke Sanetsch AG, Gsteig b. Gstaad, 1 Messergebnis
- H Maggia- und Blenio-Kraftwerke AG, Locarno, 10 Messergebnisse

Die 72 Totalisatoren der MZA wurden von unseren Beobachtern betreut, wobei die freundliche Mithilfe des Eidg. Institutes für Schnee- und Lawinenforschung, Weissfluhjoch-Davos, besonders zu erwähnen ist.

H. Wolfensberger

Erläuterungen zu einzelnen Stationen (siehe Tabellen unter "Bemerkungen")

U.a. ergänzen oder korrigieren sie die Erläuterungen der letztjährigen Angaben

a) TOTALISATOREN:

- \*) Bei den mit einem Stern bezeichneten Stationen erstreckt sich die Beobachtungsperiode auf 2 Jahre (1973-75). Der gemessene 2-Jahreswert wurde reduziert und auf die Jahre 1974 und 1975 verteilt. Der reduzierte Wert für 1974 wird bei den betreffenden Stationen aufgeführt.
- 1) CABANE DES DIABLERETS: Unsicherer Wert, vermutlich wurde von Touristen Schnee in den Apparat geworfen.
- 2) BECCA D'AUDON: Apparat von Sturmwind oder Lawine zerstört.
- 3) OLDENALP: Dieser Sammler weist auffallend wenig Niederschlag auf, vermutlich ist der Apparat undicht; reduzierter Wert für 1974: 113 cm.
- 4) COL D'ORNY: Reduzierter Wert für 1974: 318 cm
- 5) MONT MINE: Reduzierter Wert für 1974: 74 cm  
Für die Stationen 3) bis 5) siehe Erläuterungen oben \*)
- 6) KLEIN MATTERHORN: Dieser Apparat lieferte seit seiner Neuaufrstellung im Jahre 1971 infolge Frostschadens oder Vereisung des Inhalts noch kein brauchbares Resultat.
- 7) TAESCHALP: Im Berichtsjahr wurde das Maximum von 67 cm ebenfalls erreicht.
- 8) MAGENHORN: Reduzierter Wert für 1974: 120 cm
- 9) KRINDI: Reduzierter Wert für 1974: 184 cm
- 10) SPAETBERGLISEE: Reduzierter Wert für 1974: 161 cm  
Für die Stationen 8) bis 10) siehe Erläuterungen oben \*)
- 11) DAUBENHORN:
- 12) STEGHORN: Die Stationen 11) bis 15) wurden
- 13) LAEMMERENPLATTEN: im Sommer 1975 aufgehoben; siehe
- 14) SCHNEEHORN: auch unter Text "Zusammenfassung"
- 15) LAEMMERENALP:
- 16) MOENCHSGRAT: Reduzierter Wert für 1974: 291 cm
- 17) KRANZBERG: Reduzierter Wert für 1974: 353 cm
- 18) KONKORDIA: Reduzierter Wert für 1974: 73 cm
- 19) DRUSBERG: Reduzierter Wert für 1974: 196 cm
- 20) BIET: Reduzierter Wert für 1974: 175 cm  
Für die Stationen 16) bis 20) siehe Erläuterungen oben \*)
- 21) ALPE FRODA (V. PEGGIA): Apparat von Lawine zerstört
- 22) ALP SUTGLATSCHER: Der Apparat wurde im April 1975 von einer Lawine fortgerissen; vorläufig keine Neuaufrstellung.
- 23) GEMSKANZEL-RHEINW.: Reduzierter Wert für 1974: 146 cm
- 24) AELPETLISTOCK: Reduzierter Wert für 1974: 156 cm
- 25) MUOTALTA-ANNAROSA: Reduzierter Wert für 1974: 122 cm
- 26) CRAPET PRASSIGNOLA: Reduzierter Wert für 1974: 127 cm
- 27) PIZ CURVER: Reduzierter Wert für 1974: 93 cm
- 28) PIZ SCALOTTA: Reduzierter Wert für 1974: 126 cm  
Für die Stationen 23) bis 28) siehe Erläuterungen oben \*)
- 29) JULIER-HOSPIZ: Der Totalisator wurde im Verlaufe des Winters 1974/75 von der Aussenlast eines Helikopters zerstört. Die Neuaufrstellung erfolgte im Sommer 1975.
- 30) ALBULA-HOSPIZ: Reduzierter Wert für 1974: 84 cm  
siehe Erläuterungen oben \*)

- 31) VAL VARUNA: Der Totalisator wurde im April 1975 vom Luftdruck einer Lawine zerstört. Die Neuaufrstellung erfolgte im Sommer 1975 (mit Standortwechsel).
- 32) CLUOZZA (BLOCKHAUS): Im Berichtsjahr wurde das Maximum von 116 cm ebenfalls erreicht.
- 33) SILVRETTA-GLETSCHERVORFELD: Reduzierter Wert für 1974: 268 cm; siehe Erläuterungen oben \*)
- 34) VAETTNERAELPLI: Die Stationen 34) bis 36) wurden
- 35) FIRST (WASSERBOEDEN): im Sommer 1975 aufgehoben; siehe
- 36) ST. MARTIN: auch unter Text "Zusammenfassung"
- 37) PANAERAAALP: Reduzierter Wert für 1974: 152 cm; siehe Erläuterungen oben \*)
- 38) SAENTIS: Siehe Bericht 1974; die Neuaufrstellung erfolgte im Sommer 1975

b) VERGLEICHSTATIONEN mit täglicher Beobachtung:

Die mit (neu) bezeichneten Regenmess-Stationen ergänzen unsere bisher verwendeten Vergleichsstationen

- 39) KIPPEL: Aufgehoben, als Ersatz ist Ried vorgesehen
- 40) SARNEN: (neu)
- 41) EIGENTHAL: (neu)
- 42) GUETSCH OB AND.: (neu)
- 43) ANDERMATT: (neu)
- 44) FUSIO: Aufgehoben, vorläufig kein Ersatz
- 45) PLATTA (MEDELS): Aufgehoben, kein Ersatz
- 46) BRAGGIO: (neu) Mittel 1961-70 (1969) interpoliert
- 47) GRONO: (neu)
- 48) SCUDELLATE: (neu)
- 49) BRUZELLA: (neu)
- 50) SAN BERNARDINO-VILLAGIO: Aufgehoben, als Ersatz ist San Bernardino-Tunnel vorgesehen
- 51) PREDA: Aufgehoben, als Ersatz ist Latsch vorgesehen
- 52) CHUR: (neu)
- 53) PLANTAHOF: (neu)
- 54) WEISSTANNEN: (neu)
- 55) GLARUS-NETSTAL: Netstal aufgehoben, als Vergleichsstation wird Glarus verwendet (bedeutend weniger Niederschlag)
- 56) SCHOENENBODEN: (neu)
- 57) STARKENBACH: (neu)
- 58) WEESEN: (neu)
- 59) SCHAENIS: (neu)

# Sonnenscheindauer 1975

## Monats- und Jahressummen in Stunden

# Agrarmeteorologische Beobachtungen

## Observations agrométéorologiques

Seit 1974 enthalten unsere Annalen für die untenstehenden agrarmeteorologischen Stationen in extenso Werte der Bodentemperaturen in verschiedenen Tiefen, der Verdunstung (Wild'sche Waage) und der Circumglobalstrahlung (Bellani) in cal/cm<sup>2</sup>.

Depuis 1974, nos annales contiennent pour les stations agrométéorologiques ci-dessous les valeurs in extenso des températures du sol aux différentes profondeurs, de l'évaporation (balance de Wild) et du rayonnement circumglobal (Bellani) en cal/cm<sup>2</sup>.

## Phänologische Beobachtungen im Jahr 1975

## Observations phénologiques en 1975

Seit 1964 enthalten unsere Annalen jeweils einige phänologische Werte. Zur Vereinfachung des Vergleichs und der Berechnung der Mittelwerte werden die phänologischen Beobachtungen nicht als Daten, sondern als Tageszahlen, beginnend mit dem 1. Januar, aufgeführt. So erscheint z. B. der 12. Mai als Tag 132. Zur Umrechnung der Tageszahlen in Kalenderdaten und umgekehrt diene nachstehende Tabelle.

Depuis 1964, nos annales contiennent certaines valeurs phénologiques. Afin de faciliter les comparaisons et le calcul des moyennes, les relevés phénologiques ne sont généralement pas publiés sous forme de dates. Afin de permettre leur transposition dans le calendrier usuel, nous donnons ci-dessous la table permettant de passer des dates aux nombres de jours et vice versa (par exemple 12 mai = 132).

| Tag/Jour: 1 | 2   | 3   | 4   | 5   | 6   | 7   | 8   | 9   | 10  | 11  | 12  | 13  | 14  | 15  | 16  | 17  | 18  | 19  | 20  | 21  | 22  | 23  | 24  | 25  | 26  | 27  | 28  | 29  | 30  | 31  |     |
|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

## Einleitung

Durch die Aerologische Station in Payerne wird alle 12 Stunden eine Radiosondierung vorgenommen. Meldetermine sind 00.00 und 12.00 Uhr Weltzeit. Für die Umrechnung auf Mitteleuropäische Zeit (MEZ) muss zur Weltzeit (GMT) eine Stunde zugezählt werden. Die Sondierung beansprucht 1 bis 1 1/2 Stunden und liegt zwischen 23.00 und 00.30, bzw. 11.00 und 12.30 Uhr MEZ.

Lage der Station Payerne :  $46^{\circ}49' N$ ,  $6^{\circ}57' E$  [ Kilometer - Koordinaten 562.200 / 184.800 ], Barometerhöhe 491 müM.

Die Daten der einzelnen Sondaufstiege und deren Zusammenfassung zu Monats- und Jahreswerten erscheinen erstmals für das Jahr 1969 in neuer Form. Folgende Einheiten und Abkürzungen werden verwendet :

### 1. Tägliche Messwerte 1-3

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| WOLKEN | = Wolkenverschlüsselung. Diese entspricht dem internationalen SYNOP - Wettermeldecode für Bodenstationen.<br>Die Verschlüsselung lautet : $N_h$ , $C_L$ , $h$ , $C_M$ , $C_H$<br>Es bedeuten :<br>$N_h$ = Bedeckungsgrad aller vorhandenen Wolken des Typus $C_L$ oder $C_M$ in Achteln:<br><br><div style="margin-left: 40px;"> 0 = 0/8    keine Wolken <math>C_L</math> und <math>C_M</math><br/> 1 = 1/8    des Himmels von Wolken bedeckt usw. bis<br/> 8 = 8/8    ganzer Himmel durch <math>C_L</math> oder <math>C_M</math> überzogen<br/> 9 =        Himmel unsichtbar wegen Nebel, Schneetreiben oder anderer Phänomene, oder Schätzung des Betrages unmöglich infolge Dunkelheit </div> |

$C_L$  = Wolken der Art Sc, St, Cu, Cb ( " tiefe Wolken " ) ohne Ns

A 6/2

- 0 = keine Wolken des Typus  $C_L$
  - 1 = Cumulus humilis ( Schönwetter Cu ) oder  
Cumulus fractus ( zerfetzte Cu )
  - 2 = Cumulus mediocris oder congestus ( mässig oder stark aufgetürmte Cu )
  - 3 = Cumulonimbus calvus ( mächtige Quellwolken mit vereisten, faserigen  
Gipfelpartien Cb )
  - 4 = Stratocumulus cumulogenitus ( aus Cu durch Ausbreitung entstandene  
Wolkenbänke, Sc )
  - 5 = Gewöhnlicher Stratocumulus ( flache Ballen, Walzen, Schollen, Sc )
  - 6 = Stratus nebulosus und / oder Stratus fractus ( Hochnebel, St )
  - 7 = Schlechtwetter- Stratus fractus und / oder Schlechtwetter - Cumulus fractus
  - 8 = Cumulus (  $C_L$  1 und / oder 2 ) und gewöhnlicher Strato-Cumulus (  $C_L$  5 ) mit  
Basis in verschiedenen Höhen
  - 9 = Cumulonimbus capillatus ( mächtige Quellwolke mit ausgeprägtem Cirrusschirm  
d.h. Schauer- oder Gewitterwolke mit Amboss
  - = nicht bestimmbar infolge Bodennebel oder dichtem Niederschlag
  - h = Höhe der Untergrenze ( Basis ) der tiefsten Wolken über dem Stationsniveau ( geschätzt ):
- |                 |                   |                                        |
|-----------------|-------------------|----------------------------------------|
| 0 = 0 - 50 m    | 4 = 300 - 600 m   | 8 = 2000 - 2500 m                      |
| 1 = 50 - 100 m  | 5 = 600 - 1000 m  | 9 = 2500 - und mehr, oder keine Wolken |
| 2 = 100 - 200 m | 6 = 1000 - 1500 m | - = Basis nicht bestimmbar             |
| 3 = 200 - 300 m | 7 = 1500 - 2000 m |                                        |

$C_M$  = Wolken der Art Ac, As, Ns ( " mittelhohe " Wolken, ausgenommen Ns )

- 0 = keine Wolken des Typus  $C_M$
- 1 = Altostratus translucidus ( dünne Schichtwolke As )
- 2 = Altostratus opacus ( dichter As ) oder Nimbostratus ( Ns gleichförmige tiefe  
Regenwolke )
- 3 = Altocumulus translucidus oder perlucidus ( Ballen, Schäfchen, mit Zwischen -  
räumen, Ac )
- 4 = Altocumulus lenticularis ( wie bei 3, aber mit Abschmelzformen Linsen, Fische )
- 5 = Altocumulus undulatus oder radiatus ( wie bei 3, aber in Verdichtung begriffen,  
d.h. Wolkenaufzug; Walzen, Reihen )
- 6 = Altocumulus cumulogenitus = Ac, der durch Ausbreitung von Cumuluswolken  
entstanden ist
- 7 = Altocumulus duplicatus oder opacus ( doppelschichtig oder dicht und ausgedehnt )  
oder zusammen mit As oder Ns
- 8 = Altocumulus castellanus ( turmartige Ac ) oder floccus ( flockig )
- 9 = Altocumulus mit dichten Cirren oder Schleiern in verschiedenen Höhen, chaotischer  
Himmel
- = nicht erkennbar, meist infolge tieferer Wolkenschichten

$C_H$  = Wolken der Art Ci, Co, Cs ( " hohe Wolken ", Eiskristallwolken )

- 0 = keine Wolken vom Typus  $C_H$
- 1 = Cirrus fibratus z. T. uncinus ( feine, faserige Cirren, zum Teil mit Krallen Ci )
- 2 = Cirrus spissatus ( dichte Cirren ) oder Ci castellanus oder floccus
- 3 = Cirrus spissatus cumulonimbogenitus ( dichte AmbossCirren aus einem  $C_L$  9 )
- 4 = Cirrus uncinus und / oder fibratus ( Haken, Krallen und / oder Streifen, die  
sich verdichten )

- 5 = Cirrus in Polarbanden und / oder Cirrostratus aufziehend und sich in Horizontnähe verdichtend
- 6 = wie bei 5 doch Verdichtung bis mehr als 45 Grad über den Horizont hinaus reichend
- 7 = Cirrostratusschleier ( Cs ) den ganzen Himmel bedeckend
- 8 = wie 7, doch meist nicht den ganzen Himmel bedeckend
- 9 = Cirrocumulus ( Cc, Cirren in Flocken, Bällchen zum Teil mit anderen Ci und Cs )
- = nicht bestimmbar, meist infolge tieferer Wolken

A 6/3

Tropopause ( Tab. 3 ) = Grenzschicht zwischen Troposphäre und Stratosphäre ( Stratosphärenbasis ). Oberhalb der Tropopause nimmt die Temperatur höchstens noch um  $2^{\circ}\text{C}/\text{km}$  ab ( Troposphäre  $5 - 8^{\circ}\text{C}/\text{km}$  ), bleibt oft konstant oder nimmt sogar mit der Höhe zu ( Stratosphäreninversion ) ; Angabe des Luftdrucks P und der Temperatur T in Troposphärenhöhe.

#### Häufigkeit und Stärke des Windes über Payerne ( Tab. 4 )

Die Windrichtungen werden in 12 Sektoren zu 30 Winkelgraden unterteilt. Es bedeuten :

- N = Anzahl Windfälle pro Monat und Aufstiegstermin auf den einzelnen Standarddruckflächen aus dem betreffenden Sektor, z. B. 343 - 012 = N-Sektor. Infolge der Rundung auf  $5^{\circ}$  - Sektoren bei den Einzelwerten entspricht die Sektormitte nicht der genauen Nordrichtung von  $360$ , sondern  $357 \frac{1}{2}$  Grad
- FFM = arithmetisches Mittel der Windgeschwindigkeit in Knoten aus der links stehenden Anzahl Fälle N
- C = Windstillen ( Calmen ) mit Anzahl N.

#### 2. Monats- und Jahreszusammenfassungen

Hier werden folgende Bezeichnungen verwendet :

- Anzahl Werte = Anzahl der ausgewerteten Sondendaten für das Bodenniveau und die Standarddruckflächen
- M = arithmetisches Mittel des Geopotentials ( H ) der Temperatur ( TM ) und der relativen Feuchtigkeit ( HUM - M ) auf dem Standardniveau
- S = Standardabweichung ( mittlere quadratische Abweichung ) von M, als Mass der Streuung der Einzelwerte um ihren Mittelwert ( rund  $\frac{2}{3}$  von ihnen liegen bei Normalverteilung innerhalb  $\pm S$ , 95% innerhalb  $\pm 2 S$  )
- MIN, MAX = Höchster und tiefster Einzelwert ( Extrema ) des Monats bzw. Jahres im entsprechenden Druckniveau des Geopotentials H und der Lufttemperatur T
- Vektoriell = mittlerer Windvektor ( Summe der einzelnen Vektoren geteilt durch Anzahl Messwerte ), Richtung in Winkelgraden und Geschwindigkeit in Knoten
- Skalar = arithmetisches Mittel aus allen einzelnen Windgeschwindigkeiten ( FFM ) in Knoten

Das Verhältnis zwischen der vektoriellen und der skalaren mittleren Windgeschwindigkeit gibt ein Mass der Beständigkeit des Windes ( Persistenz ) auf der Isobarenfläche und kann in % ausgedrückt werden.

Die Messungen wurden am Lichtklimatischen Observatorium in 1840 m Höhe mit einem Dobson-Spektrophotometer durchgeführt. Die Resultate, die mit dem C- und durch Kombination der A- und D-Wellenlängenpaare erhalten wurden, sind getrennt aufgeführt. C-Werte nach der neuen, 1968 eingeführten Skala, d.h. um 8% höher als bis Ende 1967. Viele Tagesmittel enthalten mehr Einzelwerte als hier aufgeführt sind, weshalb sie nicht immer deren arithmetisches Mittel entsprechen. Die für das Jahr 1970 in den Annalen publizierten Werte waren vom 15. April bis zum Jahresende um 2 Einheiten zu hoch.
